2. Fundamentos Git I

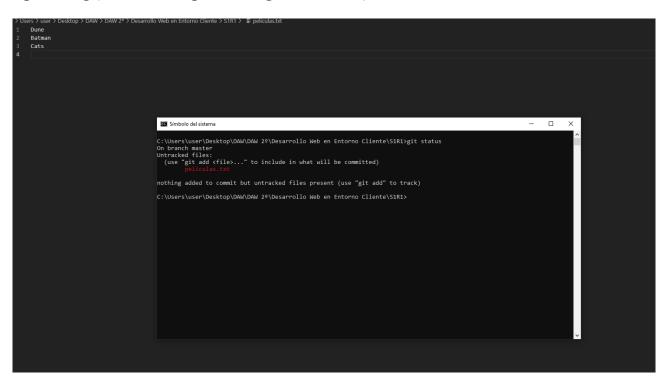

2.1. Ejecución del comando git --version

2.2. Configuración de git

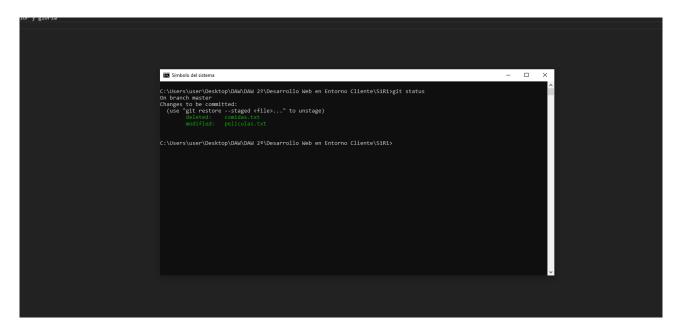

Apartado g (Git status después del segundo commit)

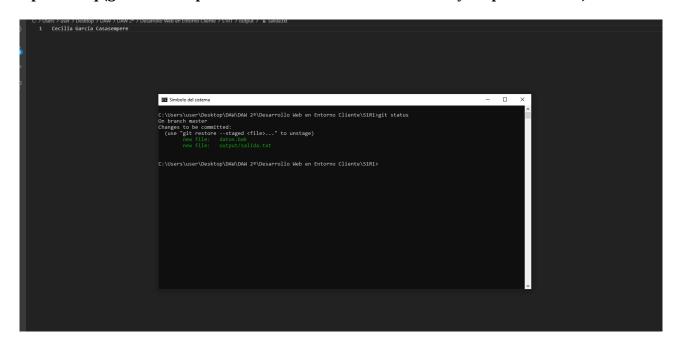

Apartado l (cambios en el directorio de trabajo después del tercer commit)

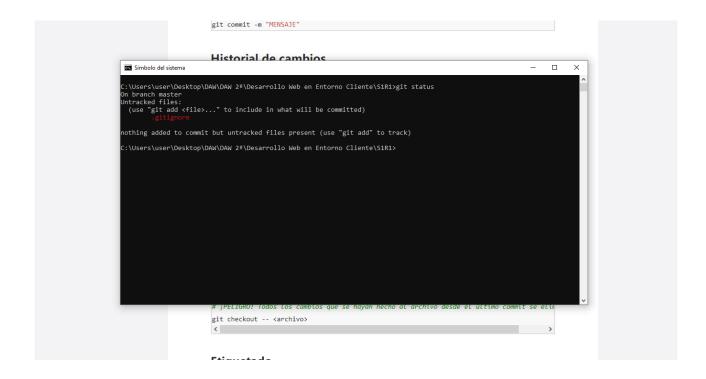

Apartado n (git status después del tercer commit)

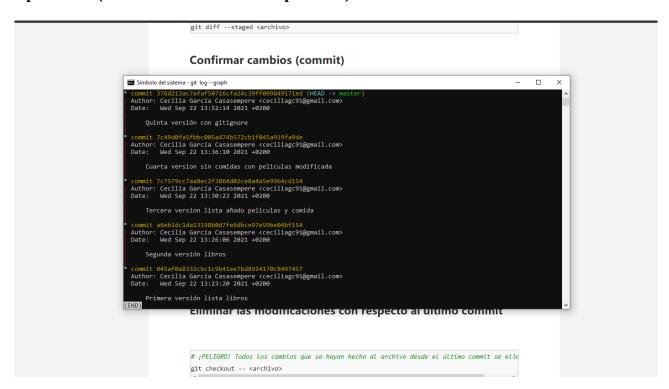

Apartado q (git status después del cuarto commit con datos.bak y output/salida.txt)

Apartado s (git status con el archivo .gitignore)

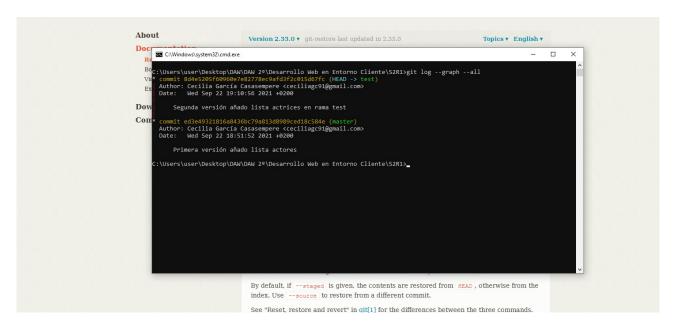

Apartado u (histórico de cambios del repositorio)

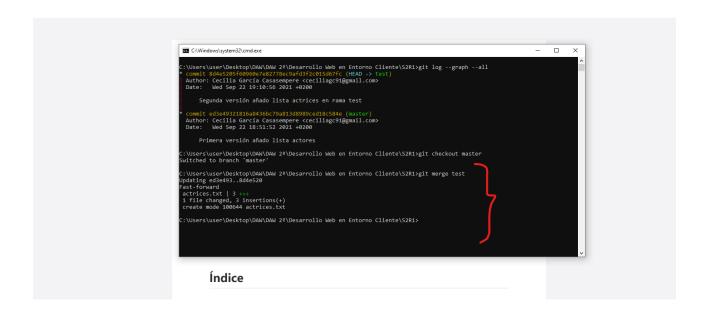

3. Fundamentos Git II

3.1.

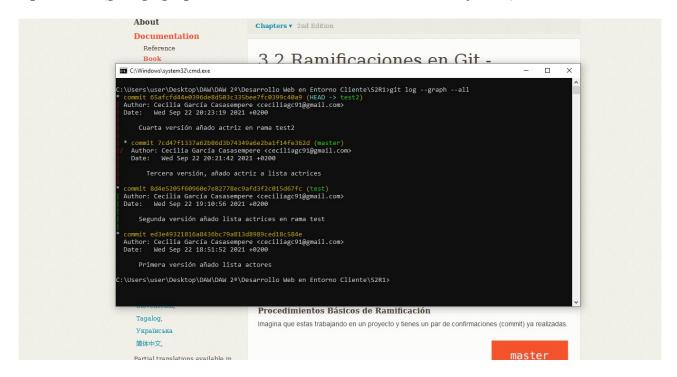

Apartado g (git log –graph –all en rama test)

Apartado i (git merge para incorporar los cambios de la rama test a la rama master)

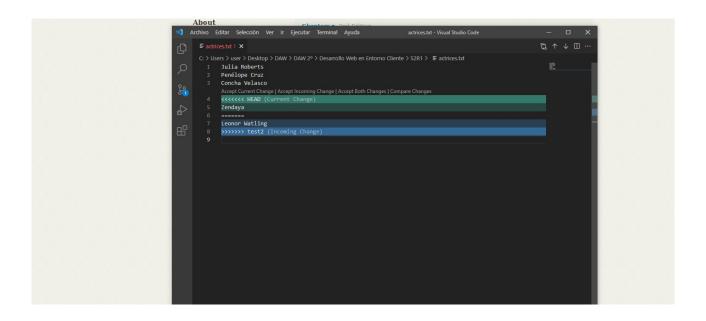

Apartado n (git log –graph –all con dos caminos distintos, master y test2)

Apartado o (conflicto al incorporar los cambios de la rama test2)

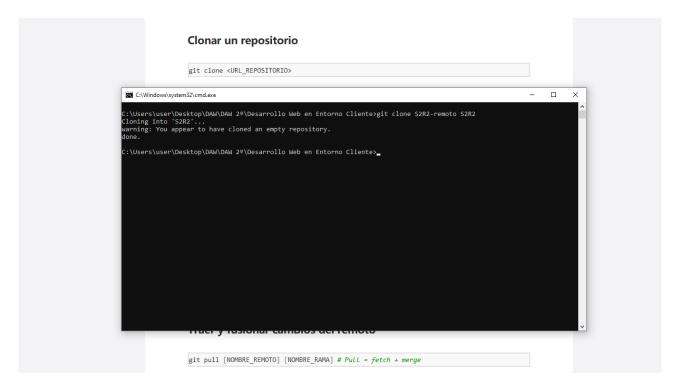

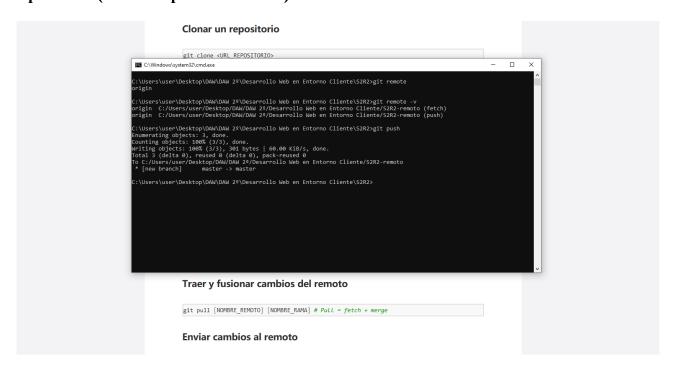

Apartado q (commit final que integra los dos caminos anteriores)

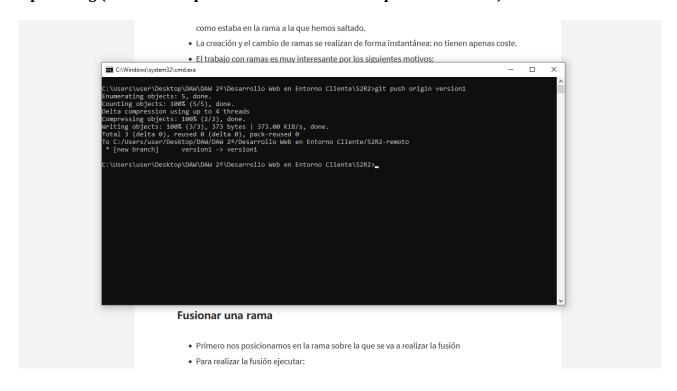

Clonado de repositorio

Apartado c (Push al repositorio remoto)

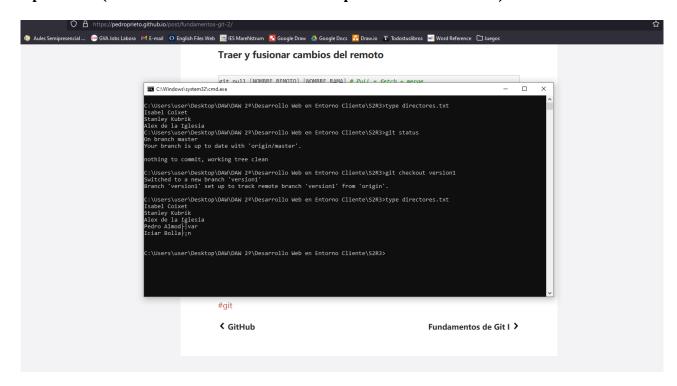

Apartado g (Push donde quede asociada la rama al repositorio remoto)

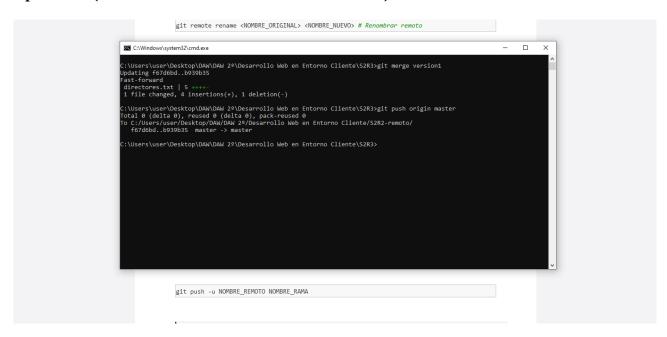

Apartado c (mostrar contenido tras clonar el repositorio S2R2-remoto)

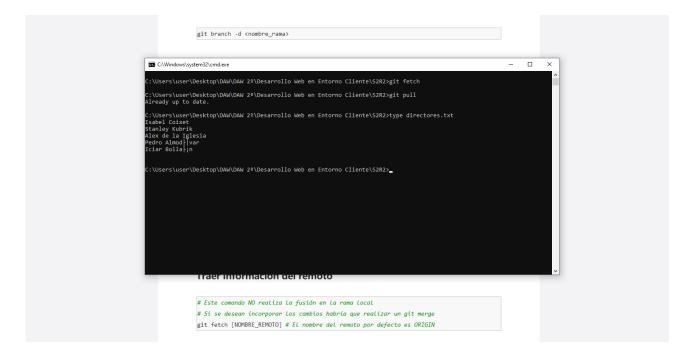

Apartado f (subir rama master actualizada al servidor)

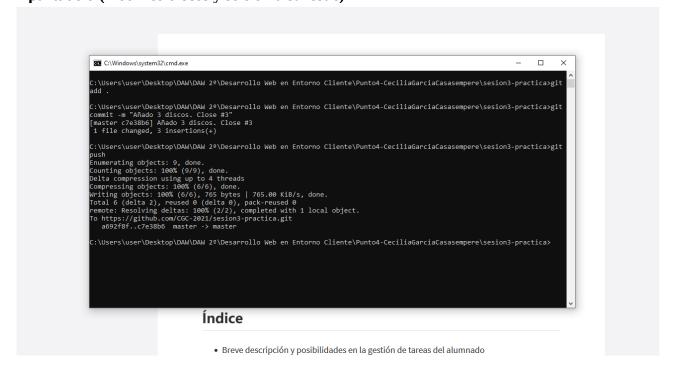

He tenido problemas con estos tres apartados.

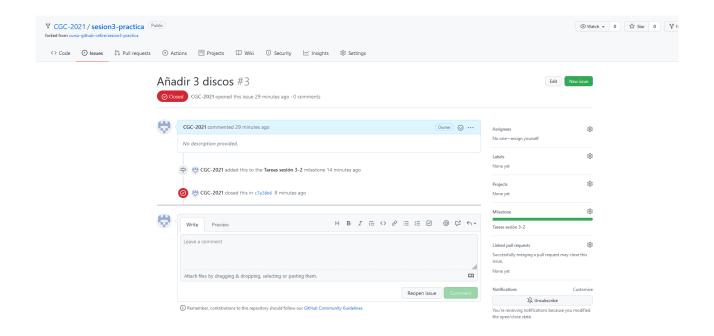

Limpié por costumbre la consola de comandos tras el "git fetch" y el "git pull" antes de hacer la captura de pantalla. Al volver al comando "git fetch" no me devolvía nada (entiendo que ya no hay nada que devolver al haberlos fusionado en la rama local). Igualmente, adjunto los resultados finales.

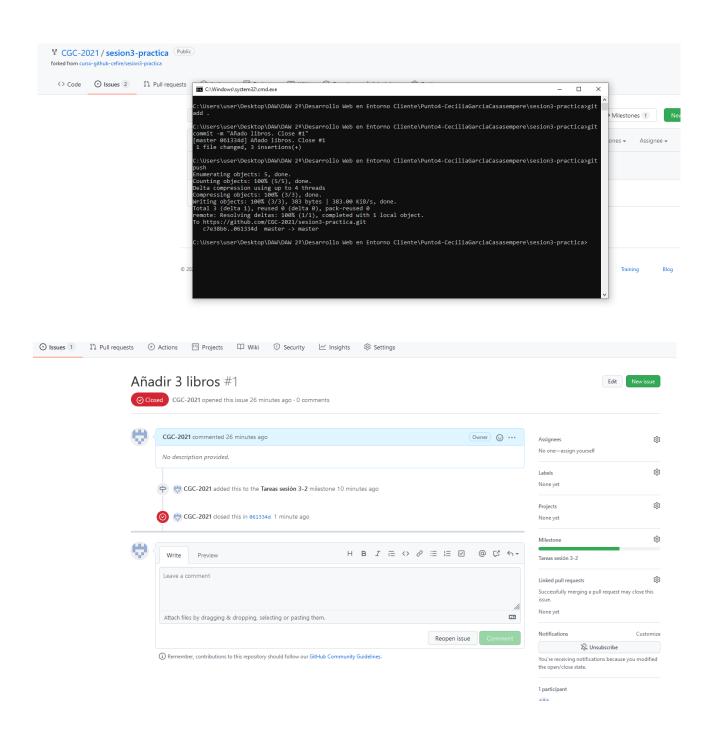

4.

Apartado d (modifico discos y se cierra su issue)

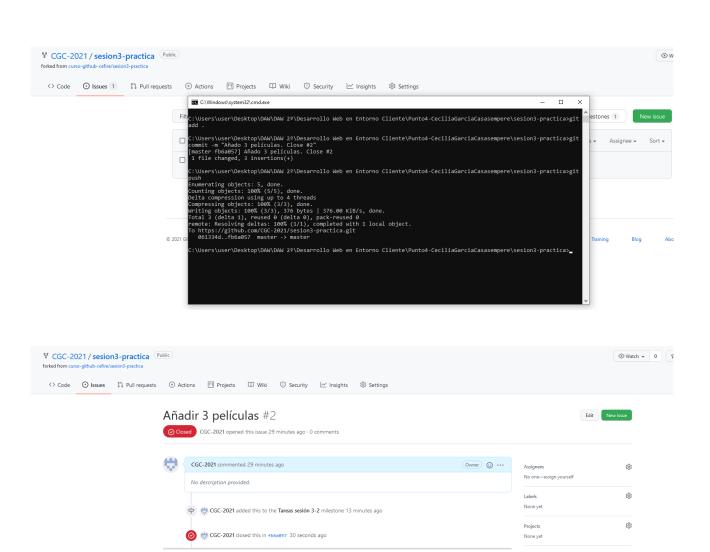

Modifico libros (y se cierra su issue)

Modifico películas (y se cierra su issue)
